Principles

HNM, ENR and ENRM relays monitor maximum and/or minimum levels of conductive liquids. The principle is based on measuring the apparent resistance of the liquid between two submerged probes. When this value is below the preset threshold displayed on the front face of the unit, the relay changes state. To avoid electrolytic phenomena, an AC current runs across the probes. A rotary switch on the front face can be used to select the desired function and sensitivity range.

Operating principles

ENR: Adjusting two levels: Minimum/Maximum

The output relay changes state when the level of liquid reaches the maximum electrode, with the minimum electrode submerged. It returns to its initial state when the minimum probe is no longer in contact with the liquid.

Note: If the power break T lasts for 1 second or more, the relay reenergises instantly when in "UP" mode and is de-energised when in "DOWN" mode.

- 1 Maximum level
- 2 Minimum level
- 3 Output relay: Up
- 4 Output relay: Down

ENRM: Monitoring a level, filling function, activation time

level: 1 - on delay, function Up LS (Low Sensitivity: 250 Ω to 5 kΩ), Up St (Standard Sensitivity: 5 kΩ to 100 kΩ), Up HS (High Sensitivity: 50 kΩ to 1 MΩ).

When the level of liquid drops below the probe for a period exceeding the value of time delay T set on the front panel, the relay energises and remains on until the level of liquid reaches the probe again.

If the level of liquid returns above the level set before the time delay elapses, the relay does not come on.

Note: When the power returns after a power break, the output relay only energises after time delay T if the level of liquid is below the threshold.

- 1 Level
- 2 Relay

ENRM: Monitoring a level, emptying function, activation time

level: 1 - on delay, function Dwn LS (Low Sensitivity: 250 Ω to 5 kΩ), Dwn St (Standard Sensitivity: 5 kΩ to 100 kΩ), Dwn HS (High Sensitivity: 50 kΩ to 1 MΩ).

When the level of liquid rises above the probe for a period exceeding the value of time delay T set on the front panel, the relay energises and remains on until the level of liquid drops back below the probe.

If the level of liquid drops back below the level set before the time delay elapses the relay does not come on.

Note: When the power returns after a power break, the output relay only energises after delay time T if the level of liquid is above the threshold.

- ① Level
- ② Relay

ENRM: Monitoring a level, filling function, deactivation time

level: 1 - off delay, function Up LS (Low Sensitivity: 250 Ω to 5 kΩ) or Up St (Standard Sensitivity: 5 kΩ to 100 kΩ) or Up HS (High Sensitivity: 50 kΩ to 1 MΩ).

When the liquid level drops below the probe the relay energises immediately and remains on until the level of liquid reaches the probe again and remains above it for a period exceeding time delay T set on the front panel.

If the level of liquid drops back below the level set before the time delay elapses, the relay remains on.

Note: When the power returns after a power break, the output relay energises immediately if the liquid level is below the threshold.

- ① Level
- ② Relay

ENRM: Monitoring a level, emptying function, deactivation time

level: 1 - off delay, function Dwn LS (Low Sensitivity: 250 Ω to 5 kΩ) or Dwn St (Standard Sensitivity: 5 kΩ to 100 kΩ) or Dwn HS (High Sensitivity: 50 kΩ to 1 MΩ).

When the level of liquid rises above the probe the relay energises immediately and remains on until the level of liquid drops back below the probe for a period exceeding the value of time delay T set on the front panel.

If the level of liquid returns above the level set before the time delay elapses the relay remains on.

Note: When the power returns after a power break, the output relay energises immediately if the level of liquid is above the threshold.

- ① Level
- ② Relay

ENRM: Monitoring two levels, emptying function

level: 2, function Dwn LS (Low Sensitivity: 250 Ω to 5 kΩ), Dwn St (Standard Sensitivity: 5 kΩ to 100 kΩ), Dwn HS (High Sensitivity: 50 kΩ to 1 MΩ).

The output relay remains open as long as the level of liquid has not reached the maximum probe. Once the maximum level is reached the contact closes and the tank can then be emptied (valve opened, pump started, etc).

When the level drops below the minimum level the contact opens and interrupts the emptying process.

Note: When monitoring two levels the time delay preventing the wave effect is not in operation. Note When the power returns after a power break, the output relay energises immediately if the level of liquid is above the threshold.

- ① Maximum level
- ② Minimum level
- ③ Output relay R filling function "Up"
- ④ Output relay R emptying function "Down"

ENRM: Monitoring two levels, filling function

level: 2, function Up LS (Low Sensitivity: 250 Ω to 5 kΩ) or Up St (Standard Sensitivity: 5 kΩ to 100 kΩ) or Up HS (High Sensitivity: 50 kΩ to 1 MΩ).

The output relay remains on as long as the level of liquid has not reached the maximum probe. As soon as the maximum level is reached the contact opens and pumping stops.

When the level drops below the minimum level the contact closes again and pumping restarts to bring the level of liquid back up.

Note: When monitoring the two levels the time delay preventing the wave effect is not in operation.

Note: When the power returns after a power break, the output relay energises immediately if the level of liquid is below the threshold.

- ① Maximum level
- ② Minimum level
- ③ Output relay R filling function "Up"
- ④ Output relay R emptying function "Down"

HNM

Parameter setting:

A rotary switch on the front face can be used to select the sensitivity range, and the emptying or filling function.

A second switch can be used to select the number of levels (1 or 2), as well as the type of time delay in the case of 1-level mode.

The configuration of these switches is taken into account on energisation.

If the switch is set to a non-conforming position on energisation, the product goes into fault mode, the output relay stays open and the LEDs flash to signal the position error.

If the switch position changes while the unit is operating, all the LEDs flash but the product continues to work normally with the function selected on energisation prior to the change of position.

The LEDs return to their normal state if the switch is reset to its initial position defined before the last energisation.

Control of two levels, emptying function:

- Level: 2, LS emptying function (Low sensitivity: 250 Ω to 5 kΩ), St emptying (Standard sensitivity: 5 kΩ to 100 kΩ), HS emptying (High sensitivity: 50 kΩ to 1 MΩ).

As long as the liquid level has not reached the probe maximum, the output relay stays open. Once the max. level is reached, the contact closes, thus allowing the tank to empty (valve opens, pump starts, etc). When the level drops below the min. level, the contact opens to interrupt the emptying process. NB: In two-level control mode the time delay for preventing wave effect is not active. Control of two levels, filling function.

- Level: 2, LS filling function (Low sensitivity: 250 Ω to 5 kΩ), St filling (Standard sensitivity: 5 kΩ to 100 kΩ), HS filling (High sensitivity: 50 kΩ to 1 MΩ).

As long as the liquid level has not reached the probe maximum, the output relay stays closed. Once the max. level is reached, the contact opens and pumping stops. When the level drops below the min. level, the contact closes again and pumping restarts so as to make the liquid level rise again. NB: In two-level control mode the time delay for preventing wave effect is not active.

- ① Maximum level
- ② Minimum level
- ③ Output relay R filling function "Up"
- ④ Output relay R emptying function "Down"

HNM: One-level control (min. probe), filling function, on-delay

Level: 1 - on-delay, LS filling function (Low sensitivity: 250 Ω to 5 kΩ), St filling (Standard sensitivity: 5 kΩ to 100 kΩ), HS filling (High sensitivity: 50 kΩ to 1 MΩ).

When the liquid level drops below the probe for a duration longer than the value of time delay T_t set on the front face, the relay closes and stays closed until the liquid level reaches the probe again. If the liquid level rises back above the level set before the end of the time delay, the relay does not close.

- ① Min. probe level
- ② R output relay

HNM: One-level control (min. probe), filling function, off-delay

Level: 1 - off-delay, LS filling function (Low sensitivity: 250 Ω to 5 kΩ) or St filling (Standard sensitivity: 5 kΩ to 100 kΩ) or HS filling (High sensitivity: 50 kΩ to 1 MΩ).

When the liquid level drops below the probe, the relay closes instantly and stays closed until the liquid level reaches the probe again and stays above it for a duration longer than time delay T_t set on the front face. If the liquid level drops back below the level set before the end of the time delay, the relay stays closed.

- ① Min. probe level
- ② R output relay

HNM: One-level control (min. probe), emptying function, on-delay

Level: 1 - on-delay, LS emptying function (Low sensitivity: 250 Ω to 5 kWΩ), St emptying (Standard sensitivity: 5 kΩ to 100 kΩ), HS emptying (High sensitivity: 50 kΩ to 1 MΩ).

When the liquid level rises above the probe for a duration longer than the value of time delay T_t set on the front face, the relay closes and stays closed until the liquid level drops back below the probe.

If the liquid level drops back below the level set before the end of the time delay, the relay does not close.

- 1 Min. probe level
- 2 R output relay

HNM: One-level control (min. probe), emptying function, off-delay

Level: 1 - off-delay, LS emptying function (Low sensitivity: 250 Ω to 5 kΩ), St emptying (Standard sensitivity: 5 kΩ to 100 kΩ), HS emptying (High sensitivity: 50 kΩ to 1 MΩ).

When the liquid level rises above the probe, the relay closes instantly and stays closed until the liquid level drops back below the probe for a duration longer than the value of time delay T_t set on the front face. If the liquid level rises back above the level set before the end of the time delay, the relay stays closed.

- 1 Min. probe level
- 2 R output relay
